EDUCATION

King Mongkut's University of Technology Thonburi
Bachelor of Computer Engineering (Regular Program)

August 2024 - Present
GPAX : 3.63

Kasetsart University Laboratory School Kamphaeng Saen Campus
Educational Research and Development Center (SciUS Program)

June 2021 - April 2024
GPAX : 3.98

WORK & COMPETITION EXPERIENCE

AI Engineer Intern, Oneput Technology Company Limited - Bangkok, Thailand

1 March 2026 - Present

- Developed an end-to-end multi-modal RAG pipeline for ESG documents using ColPali, Docling, Typhoon OCR 1.5 (VLM), and PyThaiNLP to extract structured data from complex layouts, infographics, charts, tables, and multi-format files (PDF/Excel). Engineered a FastAPI backend with asynchronous ingestion and Hybrid Search (ChromaDB + TF-IDF) enhanced by RRF to improve retrieval accuracy across Thai and English contexts, enabling LLMs to query specific financial and ESG data points from visual and textual sources.

Winner, Super AI Engineer SS6 Level 2 - Demand Forecasting Coffee Chain Hackathon

12 - 15 May 2026

- Performed deep EDA on 2.86M transactions and 1.37M orders for MAE-based multi-horizon demand forecasting (1D/7D/1M) across 20 stores and 7 product categories. Extracted actionable signals from ACF, seasonality, promotion lift, holiday/payday uplift, rainy-season effects, stockouts, local events, and store-capacity patterns, translating them into leakage-aware lag, rolling, calendar, and interaction features that supported the team's winning solution.

Top 10 Finalists - CAI CAMP 2025: PromoAutomate

1 August - 26 October 2025

- Developed an AI-driven PromoAutomate system reducing coupon setup time by 2,192 hours/month through real-time barcode verification with Computer Vision. Integrated Stable Diffusion + LoRA for promotion artwork generation and built a centralized dashboard to streamline workflows and reduce manual errors.

AWARD AND CERTIFICATES

Super AI Engineer Season 5 Level 1 - Hackathon

24 January - 1 Mar 2025

- Developed diverse baseline AI solutions across 5 hackathon domains: fine-tuned WangchanBERTa-LST20 with SimpleTransformers for **Thai Named Entity Recognition**, implemented a **Thai Image Captioning** pipeline using BLIP-2 with output post-processing, and built a **Heart Disease Prediction** system with PyCaret, SMOTE-based class balancing, and evaluation using AUC and Accuracy. Additionally, developed a **House Recognition** image classification pipeline using Timm and FastAI, and applied AutoGluon to classify **Sleep Stage Classification** from physiological signals. Demonstrated foundational end-to-end AI engineering skills across NLP in **Named Entity Recognition**, Computer Vision, Data Science, and IoT, covering preprocessing, model training, feature extraction, tuning, and evaluation.

Super AI Engineer Season 5 Level 2 - AI Engineer Track (Online)

2 June - 28 June 2025

- Developed diverse AI solutions across 4 key hackathons: engineered a **Financial Analysis Agent** using OpenTyphoon LLM with advanced prompt logic, built a **Liver Fibrosis Severity Prediction** system using PyTorch CNNs, and created a **Cognitive Profiling Prediction** model via sequential data analysis. Additionally, implemented **Bias Correction for GSMaP** satellite data using Machine Learning. Demonstrated end-to-end expertise in clinical imaging, Fintech, and Environmental AI by managing complex pipelines from data augmentation and preprocessing to model optimization and evaluation for high-stakes industrial challenges.

Super AI Engineer Season 6 Level 1 - Hackathon

13 March - 4 April 2026

Passed Baseline Hackathon

- **OCR : OCR for Thai Election Results 2026:** Developed an end-to-end OCR pipeline with Typhoon OCR and with fuzzy string matching to accurately extract and clean data from official Thai election documents.

- **RAG: FahMai RAG Challenge:** Architected a RAG system using Hybrid Retrieval (BM25 & BGE-M3) and Reranking to enhance retrieval precision for specialized knowledge-based QA tasks.

PROJECT EXPERIENCE

TrashReg: The trash bin facilitates waste separation

28 October - 15 December 2024

- Developed a YOLO v11 and Arduino Mega 2560-integrated system to classify five waste categories with high precision and recall. Featuring an automated servo-driven sorting mechanism, the project enhances recycling efficiency and reduces manual errors, directly supporting sustainable waste management aligned with SDG 11 (Sustainable Cities) and SDG 13 (Climate Action).

Skills : Python, Java, C, C++, C#, SQL, Linux, Gitlab, Scikit-Learn, Matplotlibs, Pandas, HTML, CSS, TypeScript

Language : Thai - Native, English - CU-TEP Score 59/120, Spanish - studying
