EDUCATION

King Mongkut's University of Technology Thonburi
Bachelor of Computer Engineering (Regular Program)

August 2024 - Present
GPAX : 3.63

Kasetsart University Laboratory School Kamphaeng Saen Campus
Educational Research and Development Center (SciUS Program)

June 2021 - April 2024
GPAX : 3.98

WORK & COMPETITION EXPERIENCE

AI Engineer Intern, Oneput Technology Company Limited - Bangkok, Thailand

1 March 2026 - Present

- Developed an end-to-end multi-modal RAG pipeline using ColPali and Docling to extract structured data from complex ESG layouts, infographics, and multi-format files (PDF/Excel).
- Engineered a FastAPI backend supporting asynchronous ingestion and Hybrid Search (ChromaDB + TF-IDF) with RRF to optimize retrieval accuracy for both Thai and English contexts.
- Leveraged Typhoon OCR 1.5 (VLM) and PyThaiNLP for high-fidelity Thai extraction and visual reasoning, enabling LLMs to query specific financial data points from charts and tables.

Top 10 Finalists - CAI CAMP 2025: PromoAutomate

1 August - 26 October 2025

- Developed an AI-driven system reducing coupon setup time by 2,192 hours/month using a Computer Vision-based AI Proofing System for real-time barcode verification. Integrated Stable Diffusion with LoRA to automate high-quality promotion artwork generation via text prompts and established a centralized dashboard to streamline workflows and eliminate manual errors.

AWARD AND CERTIFICATES

Super AI Engineer Season 5 Level 1 - Hackathon

24 January - 1 Mar 2025

Passed Baseline Hackathon

- NLP: Named Entity Recognition:** Used the WangchanBERTa-LST20 model fine-tuned using SimpleTransformers to predict entity types in Thai text, such as person names, organizations, and locations.
- Image Processing: Thai Language Image Captioning:** Using Blip2ForConditionalGeneration pre-trained models to process images and generate captions. The workflow includes post-processing for clean caption outputs.
- Data Science: Heart Disease Prediction:** Trained with PyCaret for model creation and tuning, preprocesses data with SMOTE for balancing, and evaluates models using metrics like AUC, Accuracy and logistic regression.
- 5 Domains Hackathon Image Processing: House Recognition:** Used libraries like Timm and Fastai, loads and preprocesses image data, and sets up a data pipeline for training.
- 5 Domains Hackathon IoT: Sleep Stage Classification:** Trained with AutoGluon to classify sleep stages from physiological data. It preprocesses the data, trains a model, extracts features data to predicts sleep stages.

Super AI Engineer Season 5 Level 2 - AI Engineer Track (Online)

2 June - 28 June 2025

- Developed diverse AI solutions across 4 key hackathons: engineered a **Financial Analysis Agent** using OpenTyphoon LLM with advanced prompt logic, built a **Liver Fibrosis Severity Prediction** system using PyTorch CNNs, and created a **Cognitive Profiling Prediction** model via sequential data analysis. Additionally, implemented **Bias Correction for GSMAp** satellite data using Machine Learning. Demonstrated end-to-end expertise in clinical imaging, Fintech, and Environmental AI by managing complex pipelines from data augmentation and preprocessing to model optimization and evaluation for high-stakes industrial challenges.

Super AI Engineer Season 6 Level 1 - Hackathon

13 March - 4 April 2026

Passed Baseline Hackathon

- OCR : OCR for Thai Election Results 2026:** Developed an end-to-end OCR pipeline with Typhoon OCR and with fuzzy string matching to accurately extract and clean data from official Thai election documents.
- RAG: FahMai RAG Challenge:** Architected a RAG system using Hybrid Retrieval (BM25 & BGE-M3) and Reranking to enhance retrieval precision for specialized knowledge-based QA tasks.

PROJECT EXPERIENCE

TrashReg: The trash bin facilitates waste separation

28 October - 15 December 2024

- Developed a YOLO v11 and Arduino Mega 2560-integrated system to classify five waste categories with high precision and recall. Featuring an automated servo-driven sorting mechanism, the project enhances recycling efficiency and reduces manual errors, directly supporting sustainable waste management aligned with SDG 11 (Sustainable Cities) and SDG 13 (Climate Action).

Skills : Python, Java, C, C++, C#, SQL, Linux, Gitlab, Scikit-Learn, Matplotlibs, Pandas, HTML, CSS, TypeScript
Language : Thai - Native, English - CU-TEP Score 59/120, Spanish - studying
